## Unit 2 - M\&M Isotope Lab (Make Up)

## Introduction

Isotopes are atoms of the same chemical element, each having a different mass number (different number of neutrons). Isotopes differ in mass number but never in atomic number (\# of protons). Since we cannot see atoms, you will use M\&M's to represent atoms. The purpose of this lab is to calculate the average atomic mass using M\&M's, and to observe the difference between isotopes.

1. The mass number of the atom is the total number of $\qquad$ \&
2. Isotopes are different types of atoms of the same element, but with a different number of $\qquad$
3. Carbon-13 is an isotope of Carbon with a mass number of 13 . How many neutrons are in Carbon-13? $\qquad$

## Refer to this picture of an atom's nucleus to answer questions 4-9.

4. How many protons? $\qquad$
5. What is the atomic \#? $\qquad$
6. What element is this? $\qquad$
7. How many neutrons? $\qquad$
8. What is the mass \#? $\qquad$
9. What is the isotope name? $\qquad$

## Procedure

1. Each group of 3 will get 1 small bag of plain $M \& M^{\prime}$ s and 1 small bag of peanut $M \& M^{\prime} s$.
2. Count the number of Plain M\&M's in your bag and record this number in the data table below. Repeat this step for the Peanut M\&M's.
3. Using a piece of clean paper towel as a weighing boat, measure the total mass of your plain M\&M's and record this number in the data table. Repeat this step for the Peanut M\&M's. ***REMEMBER to ZERO out the paper towel!

| DATA TABLE: | Number of M\&M's | Mass of M\&M's |
| :---: | :---: | :---: |
| Isotope \#1 - Plain M\&M's | 20 | 17.11 |
| Isotope \#2 - Peanut M\&M's | 5 | 13.69 |
| Total Number of all your M\&M's |  |  |

Calculate the average mass of each isotope using the formula to the right.

$$
\text { Average Mass }=\frac{\text { Total Mass }}{\# \text { of } M \& M^{\prime} s}
$$

| Isotope \#1 - Plain M\&M | Isotope \#2 - Peanut M\&M |
| :--- | :--- |
|  |  |
| 10. Average mass of Isotope \#1 = | 11. Average mass of Isotope \#2 $=$ |

## Calculate the percent abundance of each

isotope. Of all the M\&M's you have, what \% \% abundance $=\frac{\# \text { of each type of M\&M }}{\text { TOTAL \# ofall M\&M's }} \times 100$ of them are plain and what $\%$ are peanut?

| Isotope \#1 - Plain M\&M | Isotope \#2 - Peanut M\&M |
| :--- | :--- |
|  |  |
| 12. \% abundance of Isotope \#1 = | 13. \% abundance of Isotope \#2 $=$ |

14. Calculate the average "atomic mass" of your M\&M's.

Average Atomic Mass $=\frac{(\text { mass of isotope } 1)(\% \text { abundance })+(\text { mass of isotope } 2)(\% \text { abundance }) \ldots}{100}$
$\square$

## Conclusion Questions

15. Is your average "atomic mass" close to or the same as students in other groups?
16. Would using king size bags of M\&M's make a difference to the average "atomic mass"? Why or why not?
17. How do Hydrogen-1, Hydrogen-2, and Hydrogen-3 differ from each other?
18. Sulfur has 4 isotopes: sulfur- 32 is $95.0 \%$, sulfur- 33 is $0.76 \%$, sulfur- 34 is $3.22 \%$, and sulfur- 36 is $0.89 \%$ abundant. Calculate its average atomic mass.
$\square$
